PROFESSIONAL SUMMARY

Technical Product Manager with a Ph.D. in Computer Science and experience in AI, multi-agent systems and simulation. Created the Product Manager role for LOTUSim and led Naval Group's first open-source product release. LOTUSim is a multi-agent simulation platform for maritime and autonomous systems research. It allows teams to build virtual scenarios with vessels, drones, sensors and effectors, then test their algorithms. Secured recurring R&D funding from executive sponsors. First-named inventor on an international patent and two-time recipient of Naval Group's Prix La Pérouse. Relocating to Abu Dhabi in early 2027 with a UAE residence visa and no need for employer sponsorship.

EXPERIENCE

Product Manager, LOTUSim Platform

Naval Group

2021 – Present

Ollioules, France

- Created the Product Manager role for LOTUSim and secured a recurring **annual R&D budget equivalent to several full-time engineers**. The budget is renewed directly with executive sponsors outside the management chain.
- Prevented duplicate tool development across **4 partner organisations** in 2025, saving approximately **€80k after onboarding costs**.
- Built the business case for further investment. The 2026 target is **€100k+ in annual savings** by reducing physical test campaigns. The final result has not yet been measured. For 2027, the projected benefit is **€500k+ in annual R&D productivity gains** from open-source contributions and AI-assisted development, equivalent to the platform's annual R&D investment.
- Secured approval from approximately **20 stakeholders across 8 functions** to release a six-year-old internal product as open source, a **first for Naval Group**. Now own its  governance, contributor workflow and AI-assisted contribution policy. Onboarded **4 external contributors** in the first year.
- Introduced a shared backlog, common development process and fixed **two-release-per-year cadence** for **6 part-time developers across 5 sites in 3 countries**, replacing siloed development. Chair the biannual strategy committee and monthly technical committee.
- Own a roadmap of approximately **50 active user stories across 6 epics**, prioritised using **5 personas** and business value. Surveyed approximately **30 users** about sensor needs, translated the findings into backlog priorities and presented the supporting ROI case to senior executives.
- Prioritised usability and documentation over stakeholder-requested demo features, keeping the roadmap focused on long-term community use.
- Grew the platform from **0 to approximately 30 users across 15 organisations** in France, Australia and Singapore. Track its use in **10+ Ph.D. projects** and **5 R&D programmes** to guide priorities. Publish a bilingual newsletter to **200 subscribers**.
- Organised the first LOTUSim technical conference (Marseille, 2026) for **50+ participants**. Managed the programme, keynote, partners, bilingual communications, registration and vetting on a minimal budget.

AI Product Integration Engineer

Naval Group

2018 – 2021

Toulon, France

- Took ownership of an AI decision-support product for ship and submarine mission planning, translating operational needs into deployable features.
- Co-invented its trajectory-optimisation method and was named first inventor on Naval Group's international patent application.
- Guided and reviewed **2 industrial Ph.D. projects** delivering applied AI solutions for naval systems.
- Built partnerships with international research laboratories and integrated external innovations into internal product roadmaps.
- Co-designed and launched an internal AI training programme with data scientists. The programme continues today at approximately **2 sessions per year**.

Ph.D. Researcher in Computer Science

Atos

2014 – 2017

Marseille, France

- Developed a weather-routing decision-support product that achieved **5% fuel-cost savings** in validation tests using time-dependent, multi-criteria route planning.
- Gathered requirements from commercial shipping stakeholders, then implemented and validated the solution in Java.

PATENT & SELECTED PUBLICATIONS

Patent: First-named inventor, *System for Planning an Optimised Trajectory of a Marine Vehicle*, international application  WO 2022/136355 A1 (Naval Group, 2022).

Author of 5+ peer-reviewed publications on AI and multi-agent systems.  Google Scholar profile.

EDUCATION

Ph.D. in Computer Science (CIFRE) <i>Aix-Marseille University / LIS Laboratory, in partnership with Atos</i>	<i>2014 – 2017</i> Marseille, France
Engineering Degree in Computer Science, specialisation in Operations Research <i>INSA Toulouse / ENAC (École Nationale de l'Aviation Civile)</i>	<i>2014</i> Toulouse, France

SKILLS

Product Management Product Strategy · Roadmaps & Backlogs · Product Discovery · User Stories · Persona-based Prioritisation · Product Analytics · Agile / Scrum · Business Cases

Leadership & Alignment Executive Stakeholder Management · Funding & Resource Mobilisation · Distributed Cross-functional Teams · Agile Transformation · Open-Source Governance · Community Building

Technical Domain AI Products · Autonomous Systems · Multi-Agent Systems · Modelling & Simulation · Multi-criteria Optimisation · Decision Support · Operations Research · Requirements Engineering

Tools Jira · Linear · GitHub · GitLab · Python · Java

AWARDS

Naval Group Scientific Innovation Award,  Prix La Pérouse *2025*
– Recognised for designing a naval cognitive twin that simulates and predicts operator and team performance in real time.

Naval Group Scientific Innovation Award,  Prix La Pérouse *2019*
– Recognised for developing an AI decision-support system for submarine route optimisation.

CERTIFICATION

Professional Scrum Product Owner™ I (PSPO I)  Certificate

LANGUAGES

French: Native | **English:** C1 | **Spanish:** B1

SIDE PROJECTS

- **DecaSaaS** (2025 – Present). B2B SaaS generating automated AI performance reports for sports clubs. Contacted approximately **600 prospects**, with approximately **100 now participating in active trials**. The first paying customers are expected by **September 2026**. Built an internal dashboard to track sign-ups and funnel conversion.
- **Data visualisation & AI tooling**. Designed a React dashboard to support training plans for running races, turning training history, fatigue, readiness and race milestones into an actionable daily view; built an agentic harness (tool orchestration, structured outputs, human-in-the-loop checkpoints) powering an interactive ecosystem map bidirectionally connected to an application-tracking pipeline, to structure and monitor a professional and organisational network end-to-end.
- **Ontology & AI planning**. Developing the open-source  LOTUSim Scenario Generator, an ontology-driven pipeline connecting mission, task, state and method catalogues to HTN planning.
